IIoT Platform

Windrock Enterprise is Dover Automation's new user-friendly analytics entry for the Industrial Internet of Things (IIoT). Dover said it has been designed with rotating equipment and other associated machinery at compressor stations and power plants in mind.

The Windrock Enterprise online dashboard provides condensed analysis of the user's entire fleet of equipment. Key indicators of health, performance, reliability, utilization and economic viability of the machines are sourced from real-time data. Built on Microsoft's Azure IoT Technologies, as well as the Azure Infrastructure-as-a-Service and Platform-as-a-Service, the dashboard can be accessed by smart phone, tablet or any computer at any time.

The dashboard is designed to present the data in an easily digestible way, which aids in quick decision-making.

Boil-off Gas Compressor For LNG-fueled Vessels

TMC is launching a new boil-off gas compressor intended for use on

vessels that use liquefied natural gas (LNG) as a fuel source.

The compressor pressurizes boil-off gas from the LNG fuel tanks and returns it to the ship's engine at the proper pressure to be burned as fuel, increasing efficiency and lowering emissions.

The compressors will be offered in several sizes ranging from 40 to 600 hp (30 to 450 kW) and can be used on vessels that run on dual fuel — for example, LNG and bunker oil — as well.
